

Keyfort™ CONTINUOUS DATA PROTECTION

The Keyfort data protection solution is a complete, disk-based backup and recovery solution that meets the needs of small-medium enterprises and remote offices. It provides real-time, hassle-free local backup, as well as hands-free offsite protection for servers laptops and PC's. The solution provides:

CONTINUOUS DATA BACKUP:

CDP detects new or changed files, even when open. When new information is found CDP automatically replicates it to dedicated hardware locally. No additional software is required, and the risk of data loss is greatly reduced as no backup windows are needed.

OFFSITE PROTECTION:

CDP has a "no-touch" offsite backup feature, which uses advanced technology to protect data against the risks of fire, theft and misplacement, or other issues associated with tape or cd-based backup.

CENTRAL MANAGEMENT & REMOTE ADMINISTRATION:

The Keyfort solution provides system activity monitoring and viewing of all agents that are active upon CDP. Consistent backup policies and control features can be enforced by IT administrators, who benefit from file level visibility to do so. Additionally, IT administrators can execute many necessary actions from remote locations that are connected to the LAN, saving both time and resources.

COMPRESSION:

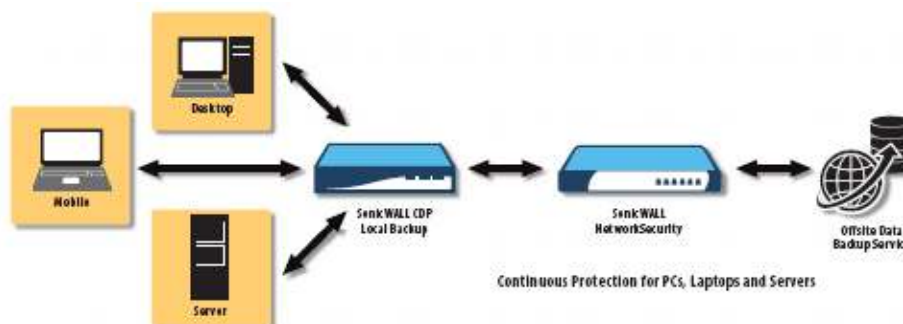

The Keyfort solution uses compression technology, ranging from 2:1 to 5:1 depending upon the type of file, allowing users to utilise disk space effectively and efficiently. This results in smaller file transfers taking place on the network.

OPEN FILE BACKUP:

The file system filter drive used within the Keyfort solution allows for new or altered data to be backed-up even whilst the files are open. Such a capability hugely reduces the chance of data becoming lost, as it is backed-up as the user creates it.

FLEXIBLE POLICIES:

This feature allows administrators to give individual users the ability to locate, view, retrieve and manipulate data based upon the level of permission they have been given by the administrators.
